February 26, 2021

## Abstract

It was recently reported that due to the COVID-19 pandemic, in the European winter 2020-2021, bronchiolitis had practically disappeared. But early reports from the southern hemisphere (Australia) raised concerns about a late spring / summer peak. After a full winter season and now ending the summer, we report that there was no peak of common respiratory viruses in late spring / summer in South America.
