The injection of super-critical CO<sub>2</sub> into the subsurface causes a disturbance in the pressure, temperature, and chemical systems within the target reservoir. How the ambient conditions change in response to a CO<sub>2</sub> injection ultimately affects the transport and fate of the injected CO<sub>2</sub>. This study is focused on gaining a better understanding of the thermal effects of a CO<sub>2</sub> injection and how the changes in temperature affect the movement and reactivity of the CO<sub>2</sub>, as well as to investigate the efficacy of using temperature as a proxy for CO<sub>2</sub> breakthrough.

## THERMAL EFFECTS

### JOULE-THOMSON EFFECT

Joule-Thomson cooling refers to the temperature drop that occurs when gas such as CO<sub>2</sub> or N<sub>2</sub> expands from high pressure to low pressure. This effect has been shown to cause 4°C to 20°C temperature decrease during CO<sub>2</sub> injection simulations.

Oldenburg (2007)

### HEAT OF DISSOLUTION

The dissolution of CO<sub>2</sub> into water is an exothermic reaction. In terms of a CO<sub>2</sub> sequestration, at the edges of the CO<sub>2</sub> plume the CO<sub>2</sub> dissolves into the reservoir water and releases heat, which results in the release of ~325 kJ/kg at 40°C.

Han et. al. (2010)

## CHEMICAL REACTIONS

Pollyea and Rimstidt (2017)

## MODEL SETUP

### RESERVOIR PARAMETERS

$P_f = 8.30 \text{ MPa}$   
 $T = 40.0 \text{ }^\circ\text{C}$   
 $\text{NaCl} = 10,000 \text{ ppm}$   
 $k = 1.0 \times 10^{-13} - 10^{-15} \text{ m}^2$   
 $\phi = 0.05 - 0.45$

### VAN GENUCHTEN PARAMETERS

Relative Permeability  
 $\lambda = 0.550$   
 $S_{ir} = 0.30$   
 $S_{is} = 1.0$   
 $S_{gr} = 0.25$   
Capillary Pressure  
 $\lambda = 0.500$   
 $S_{ir} = 0.0$   
 $\alpha \text{ (Pa}^{-1}\text{)} = 1.0$   
 $P_{\text{max}} \text{ (Pa)} = 0.25$   
 $S_{is} = 0.999$

## RESULTS

### THERMAL AND HYDRAULIC MODELING

- 432 Simulations
- Maximum Temperature = 43.6°C
- Minimum Temperature = 30.8°C
- Porosity Ranges 0.05 - 0.45

Pressure / Density  
 $8 \times 10^{-13} \text{ m}^2$  —  
 $4 \times 10^{-14} \text{ m}^2$  - -  
 $2 \times 10^{-15} \text{ m}^2$  - - -  
Temperature  
 $8 \times 10^{-13} \text{ m}^2$  - - -  
 $4 \times 10^{-14} \text{ m}^2$  - - -  
 $2 \times 10^{-15} \text{ m}^2$  - - -

## THERMAL, HYDRAULIC, AND CHEMICAL MODELING

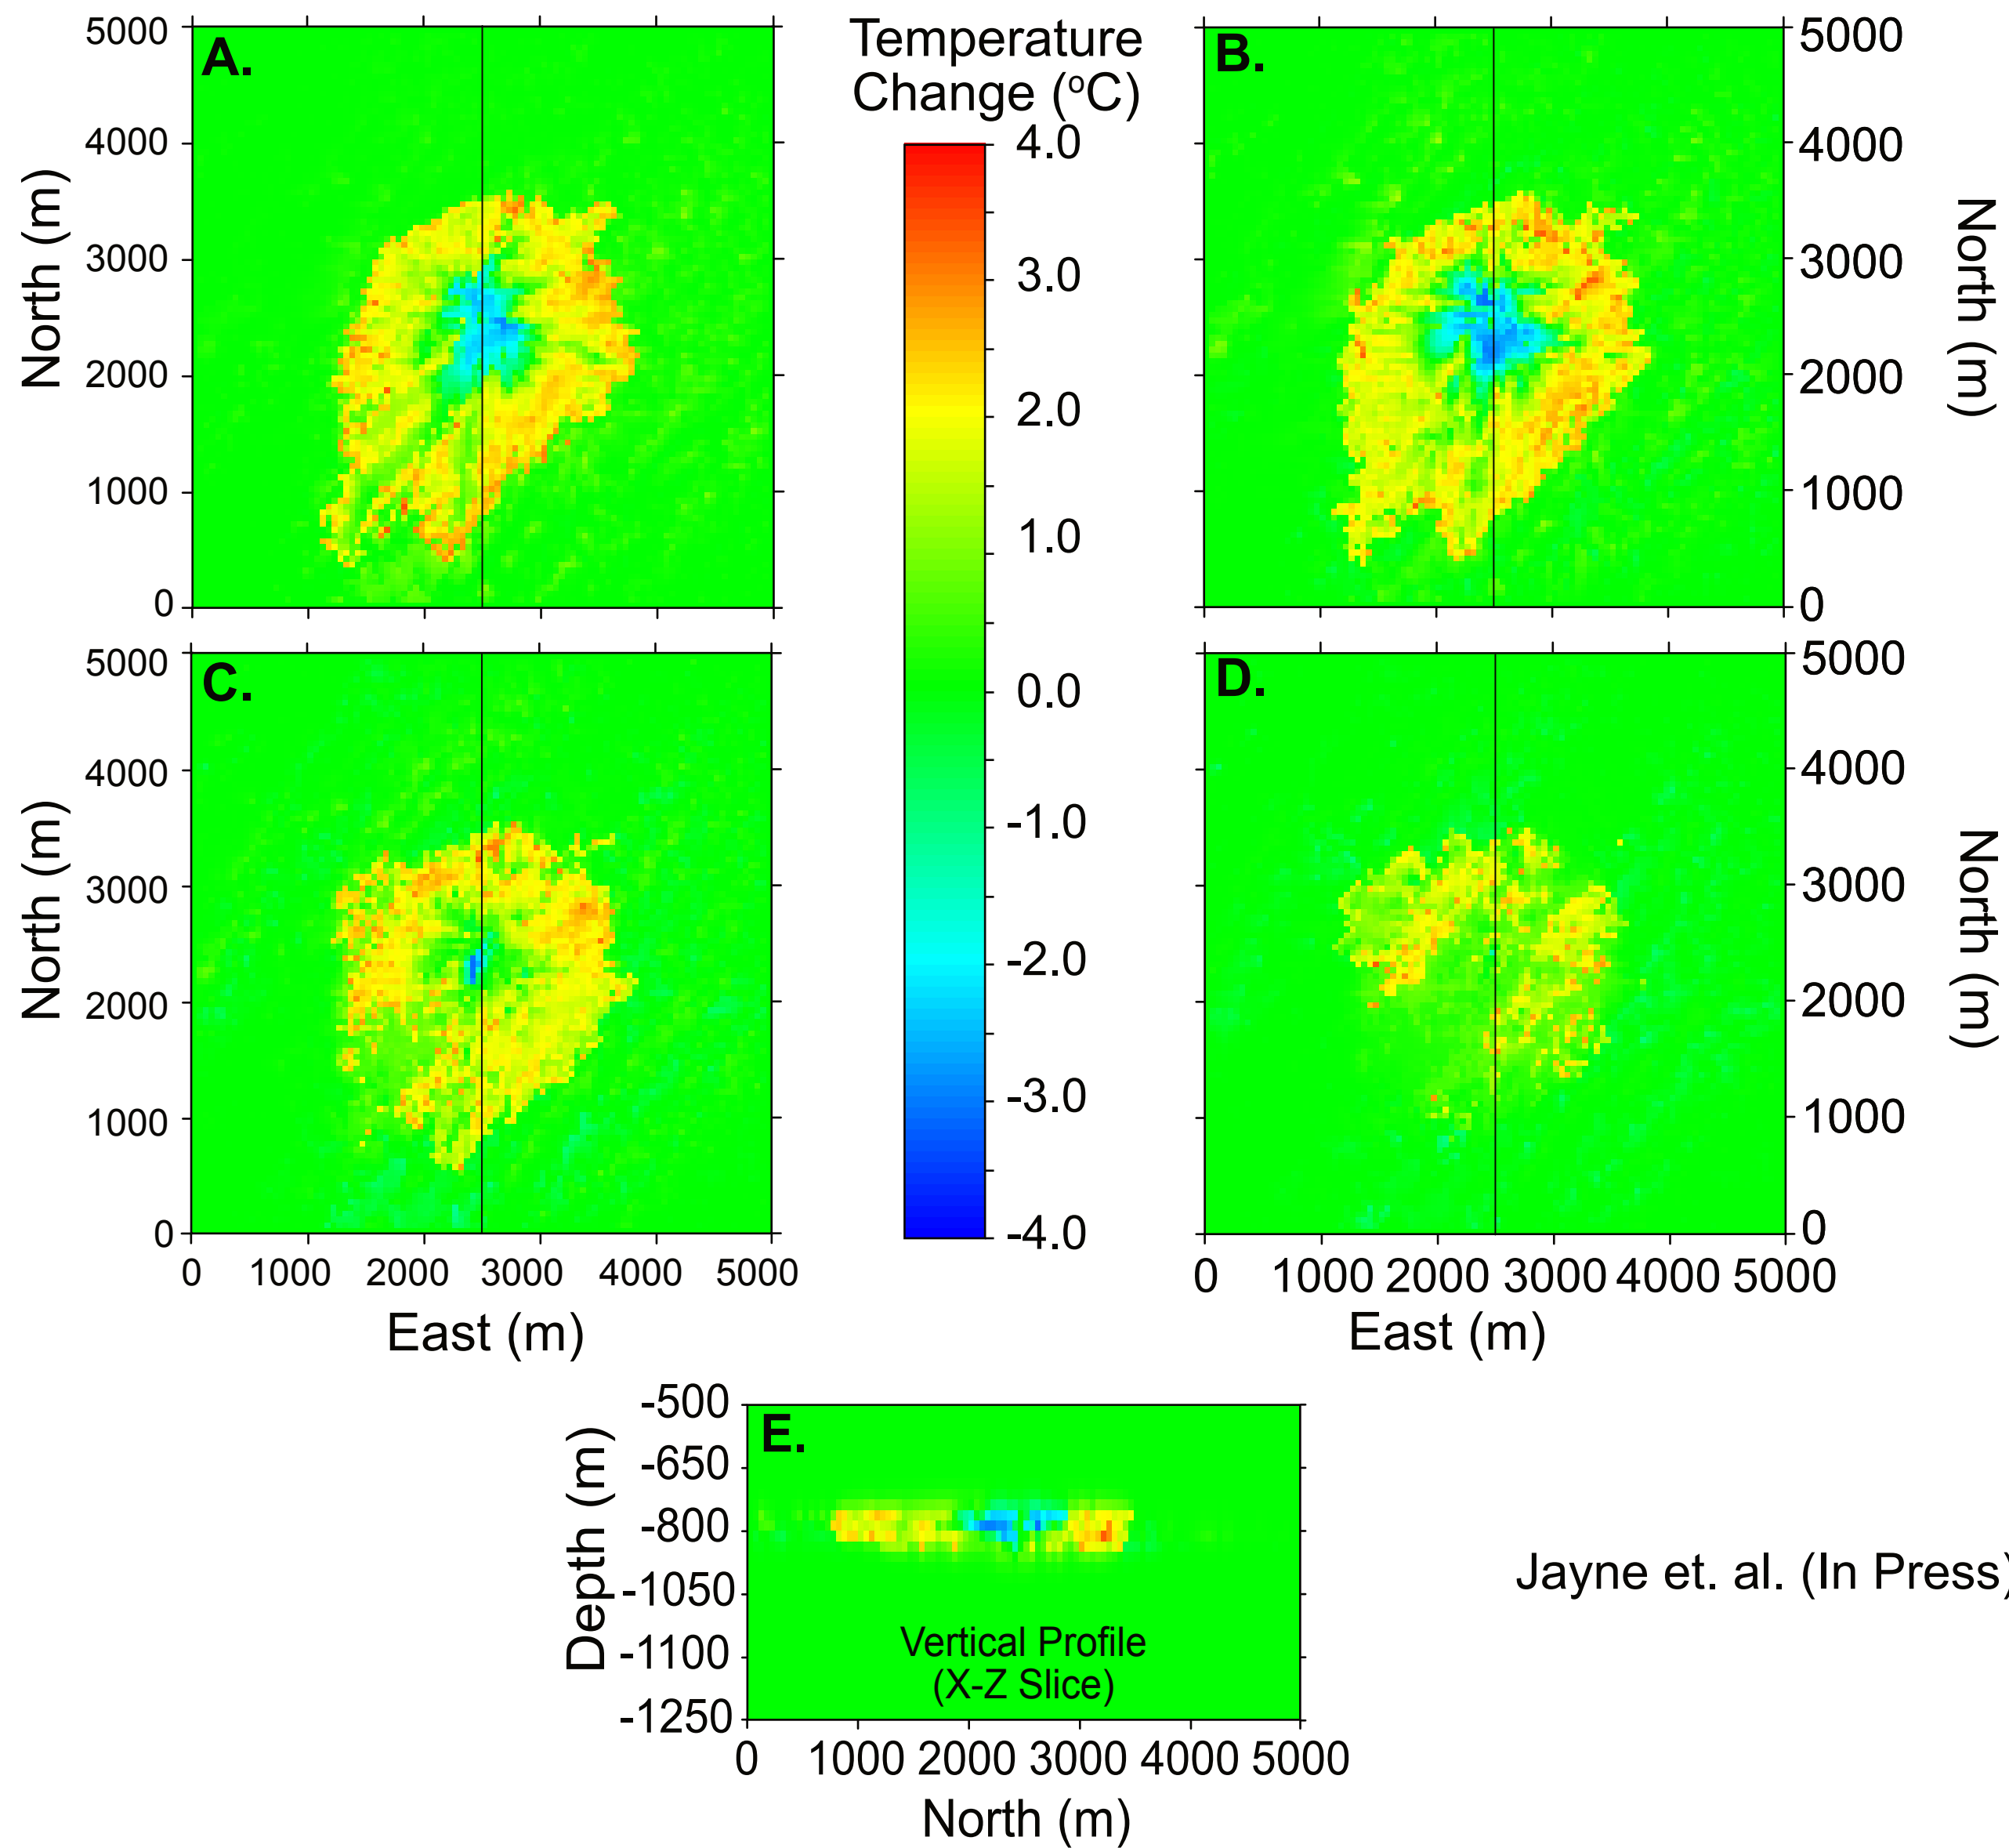

Temperature —  
CO<sub>2</sub> Saturation —  
Montmorillonite —  
Heulandite —  
Calcite —  
Siderite —  
Illite —

## IMPLICATIONS

### RESERVOIR-SCALE CO<sub>2</sub> INJECTION

Jayne et. al. (In Press)

## CONCLUSIONS/FUTURE WORK

- 1) During injection phase, heat of dissolution effects may be an effective proxy for CO<sub>2</sub> breakthrough.
- 2) Joule-Thomson cooling may exhibit some control on the precipitation of secondary mineral phases.
- 3) Due to the Joule-Thompson effect and the pressure drop in the far-field basalts exhibit self-sealing behavior.
- 4) How do heterogeneities in reservoir affect mineralization?
  - Near the well
  - Far-field and fractures (i.e. self-sealing behavior)
