

## **Table of Contents**

### **A. Water Column Microbial Respiration Assays**

- a. Modeled vs. measured dissolved oxygen concentration correlation plots 2

### **B. Statistical Analysis**

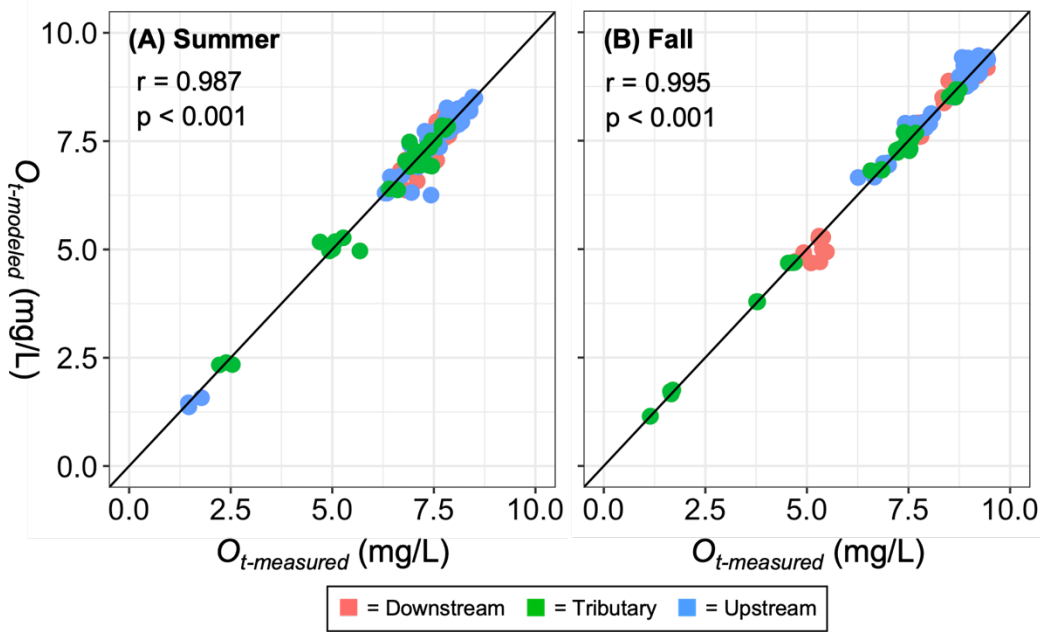

- a. Two-way ANOVA p-value table for bioreactive parameters 3

### **C. Reach Geomorphology, Water Residence Time, and Reach-Scale $k_{DO}$**

- a. Downstream vs. upstream velocity and water residence time normalized to a 100m reach correlation plots 4
- b. Upstream and downstream wetted width coefficient of variation vs. network position and tributary size plots 5

**Note:** Data and code used in the analyses of this manuscript are available at:

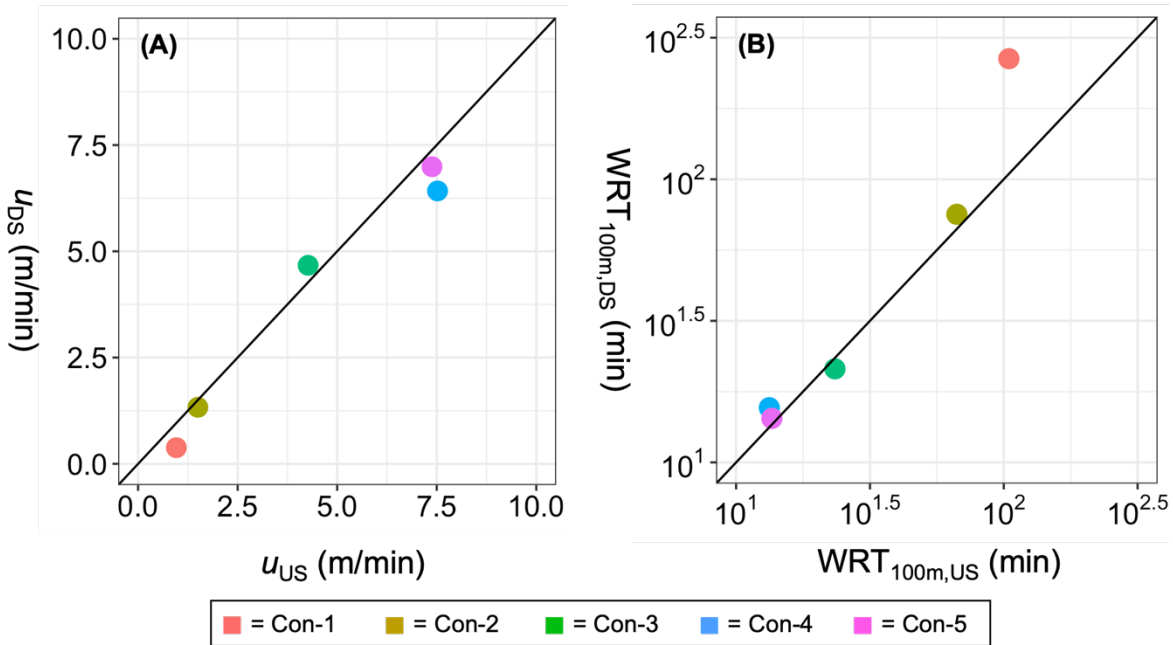

<http://www.hydroshare.org/resource/c5e687fa040e4707ba922002bafd18fd>

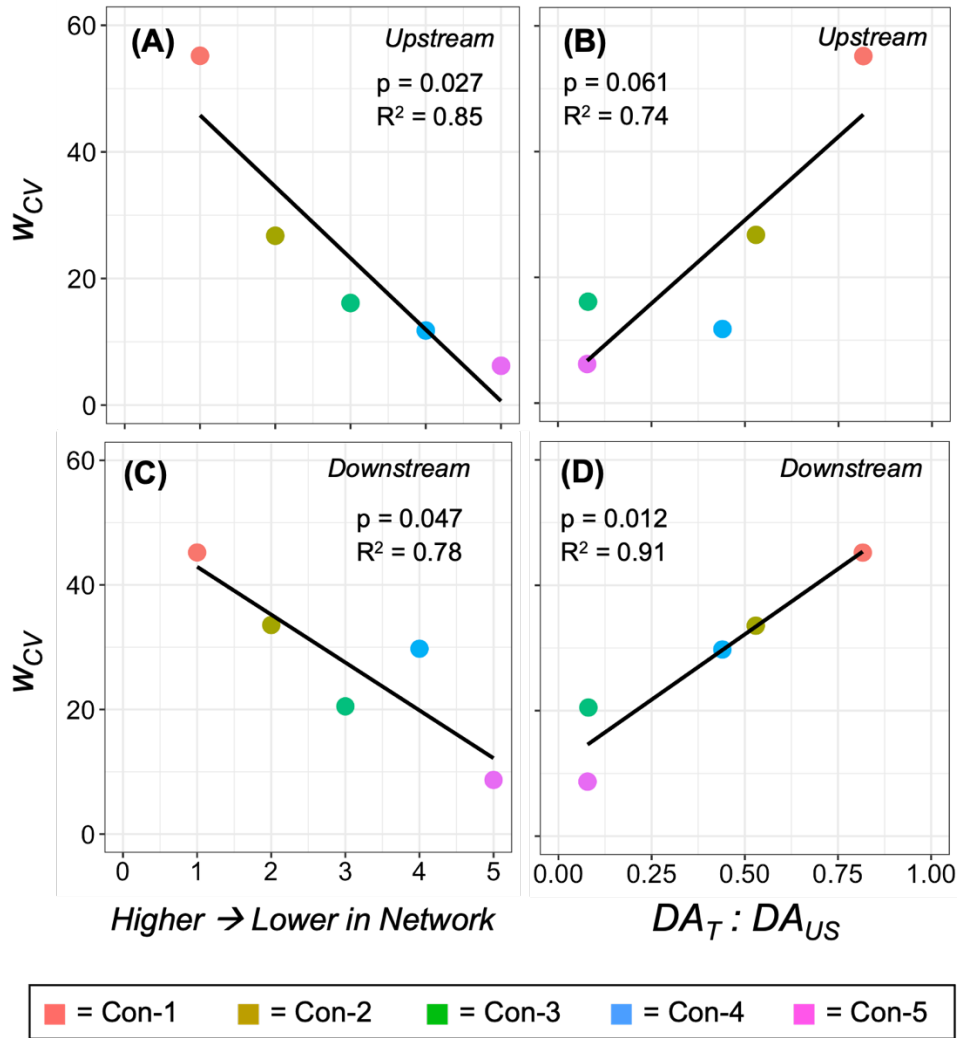

**Supplementary Figure 1:** Modeled final dissolved oxygen concentration based on water column microbial respiration rates ( $O_{t-modeled}$ , mg/L) versus measured final dissolved oxygen concentration ( $O_{t-measured}$ , mg/L) for all summer (A) and fall (B) microbial respiration assays. Black lines represent  $O_{t-modeled} = O_{t-measured}$ . Pearson correlation coefficients ( $r$ ) and  $p$ -values are included for both summer and fall results. Microbial respiration assays conducted in downstream, tributary, and upstream reaches of a confluence are represented by different colors.

**Supplementary Table 1:** Two-way ANOVA p-values for specific conductivity (SpC), microbial respiration rate ( $k_{DO}$ ), dissolved organic carbon (DOC), specific ultraviolet absorbance at 254 nm (SUVA<sub>254</sub>), peak C (C), peak T (T), peak C: peak T (C:T), ammonium (NH<sub>4</sub>-N), nitrate (NO<sub>3</sub>-N), and soluble reactive phosphorus (SRP) for each confluence. Season (summer vs. fall) and reach (US vs. DS) were treated as fixed effects. For all tests, we assigned a significance level of  $p < 0.05$ . Significant results are bolded. Significant interactions were interpreted as differences in upstream vs. downstream parameter values were seasonally-dependent.

**Supplementary Figure 2:** Downstream reach-scale velocity ( $u_{DS}$ , m/min) versus upstream reach-scale velocity ( $u_{US}$ , m/min; A) and downstream water residence time normalized to a 100 meter reach ( $WRT_{100m,DS}$ , min) versus upstream water residence time normalized to a 100 meter reach ( $WRT_{100m,US}$ , min; B). Black lines are 1:1 line for downstream and upstream  $u$  and  $WRT_{100m}$ , respectively. Each confluence is represented by a different color.

**Supplementary Figure 3:** Reach-scale coefficient of variation for wetted width ( $w_{cv}$ ) versus confluence position in the network (A for upstream reaches, C for downstream reaches) and  $w_{cv}$  versus the ratio of tributary (T) and upstream (US) watershed drainage areas ( $DA_T:DA_{US}$ ; B for upstream reaches, D for downstream reaches) for each confluence. Each confluence is represented by a different color. Black lines are linear fits of the data.  $R^2$  values from simple linear regressions are included for all parameters.
